		(3 Hours)	[Total Mark: 80]	
	N.B. (1) Question No. 1 is compulsory			
	(2) Attempt any Three Question from	m O. No. 2 to O. No 6		
	(3) Make suitable assumption if requ			
	(4) Illustrate answers with sketches v			
	(1) mustrate answers with sheetings v	more for required		
1	Solve any four questions from the	following (Five marks	each)	20
	 a) Derive an expression for one divided wall. 			
	b) Discuss the concept and applica with the practical example of ea		eady state heat transfer along	
	c) Calculate the following for an emitting radiation at 2500 °C.	industrial furnace in the	ne form of a black body and	
	i) Monochromatic emissiv	e power at 1.2 μm		
	ii) Wave length at which the	ne emission is maximur	n S S	
			assumed as real surface with	
	d) Discuss in detail about the effect engines.	ct of engine variables or	n detonation in Spark ignition	
	e) A cylinder rod of 1 cm diamete suddenly dropped in oil at 50 ° W/m ² K. Find the time required t is as follows: Density = 8000 kg/m ³ . C=400 J	C having convective he to cool the rod up to 120	eat transfer coefficient at 240	
	f) Engine oil at 60°C flows over temperature is 20°C with a veloc rate of heat transfer per unit with Properties of oil are as follows:	r the upper surface of ocity of 2 m/s. Determine the of the entire plate.		
	Density=876 kg/m ³ , Pr = 2870 viscosity = 242 x 10^{-6} m ² /s		= 0.144 W/m°C, Kinematic	
2	(a) An aluminum rod 2 cm diameter ar 300 °C. The rod is exposed to surr rod surfaces an environment is 20 200 W/mK. Find	roundings at 15°C. Hea	t transfer coefficient between	12
	i) Total heat dissipated by rod			
	ii) Temperature of road at 4 cn			
	iii) Temperature at the end of roiv) Fin efficiency	ou S		
	IV) I'III CITICIETICY	~O		

What are the different control methods for engine emissions The following details were noted in a test on a four-cylinder, four-stroke engine, diameter

Assume that the rod end is insulated

80%, calculate

Q.

10 = 100 mm; stroke = 120 mm; speed of the engine = 1600 rpm; fuel consumption = 0.2 kg/min; calorific value of fuel is 44000 kJ/kg; difference in tension on either side of the brake pulley = 40 kg; brake circumference is 300 cm. If the mechanical efficiency is

08

(i) brake thermal efficiency (ii) indicated thermal efficiency (iii) indicated mean effective pressure and (iv) brake specific fuel consumption

Page 1 of 2

(b) Derive an expression for temperature distribution and heat dissipation in a straight fin of

- Q. 4 (a) A furnace walls made up of three layers, one of fire brick, one of insulating brick and 12 one of red brick. The inner and outer surfaces are at 870°C and 40°C respectively. The respective co- efficient of thermal conductivities of the layer are 1.0, 0.12 and 0.75 W/mK and thicknesses are 22 cm, 7.5 cm, and 11 cm. Assuming close bonding of the layer at their interfaces, find the rate of heat loss per sq. meter per hour and the interface temperatures if the convective heat transfer coefficient of the atmosphere 40 W/m²°C and atmospheric temperature is 20°C.
 - (b) Discuss about the actual and ideal valve timing diagram for four stroke petrol engine. 08
- Q. 5 (a) A four stroke gas engine has a cylinder diameter of 25 cm and stroke 45cm. The effective diameter of the brake is 1.6m. The observations made in the test of the engine were as follows.

 Duration of the test 40 minute, total number of revolutions = 8080. Total no of explosions = 3230, net load on the brake = 90 kg, mean effective pressure = 5.8 bar, volume of gas used = 7.5 m³, pressure of gas indicated in a meter = 136 mm of water of gauge, atmospheric temperature = 17 °C, calorific value of the gas 19 MJ/m³ at NTP. Rise in temperature of the jacket cooling water= 45 °C, Cooling Water Supplied 180 Kg. Draw up the heat balance sheet and estimate the indicated thermal efficiency and brake thermal efficiency. Assume atmospheric pressure as 760 mm of Hg
 - (b) State and explain different factors affecting on ignition delay period in compression 08 ignition engine
- Q. 6 (a) Water(mass flow rate of 1.4 kg/s, Cp= 4.187 kJ/kgK) is heated from 40 °C to 70 °C by 08 an oil (mass flow rate 2kg/s, Cp 1.9 kJ/kgK) entering at 110 °C in a counter flow heat exchanger. If overall heat transfer coefficient is 350W/m²K, Calculate the surface area required. Also find the surface area required if it's a parallel flow heat exchanger.
 - (b) Explain the following (**Four marks each**)

rectangular profile for insulated tip.

- i) What is the governing law of diffusion mass transfer?
- ii) Draw a boiling curve for water and show and explain the different boiling regimes. Explain the phenomenon of condensation.

12

Derive an expression for log mean temperature difference in parallel flow heat exchanger. State your assumption
